

Center for Cybersecurity

The Center for cybersecurity aims to constantly improve cyber risk management by focusing on two main research areas: **digital identity** and **virtual service quality**. Recently, the center has begun to focus on **analyzing the risks of AI application**.

It has established close connections with the private sector and the various companies working in the context: its main contacts include the **Bit4ID** Group, part of the **Namirial** platform, and **Deda Group**.

In addition, **the center boasts a long-lasting collaboration with Istituto Poligrafico e Zecca dello Stato**, the Italian State Printing Works and Mint: it has, in fact, contributed to the design and security analysis of authentication solutions based on the electronic identity card (CIE 3.0) and to the creation of a portable digital identity solution that complies with the **eIDAS framework**.

Most recently, the center has been involved in the **Large Scale Pilot Potential**, aimed at testing new EU digital identity wallet prototypes (**European wallet**).
