

## Center for theoretical studies in nuclear physics and related areas

The European center for theoretical studies in nuclear physics and related areas provides a dedicated and structured set of scientific activities for a broad international scientific community. It intends: to be a **frontier research center in theoretical nuclear physics where researchers coordinate experimental and theoretical** work aimed at gaining new insights into the fundamentals of observable phenomena and facts, independent of the prediction of direct practical applications or uses; to **promote active contacts between theory and experiment** and related research areas; and to further the **training of young researchers**.

In addition to a robust field research program involving senior and junior researchers, the center's main activities include workshops, training programs for doctoral students, and specialized courses. It also offers visiting fellowships for junior and senior researchers.
